

## IEEE EDUCATION ON THE INTERNET

Lyle D. Feisel<sup>1</sup>

*Abstract - The face of education has been changed significantly by the advent of the Internet. Adult or continuing education, in particular, is benefiting from the opportunities that this new medium of communication affords. With teacher and student no longer bound by the limits of space and time, educational organizations must determine new ways of delivering educational activities or they will be left behind.*

*The Institute of Electrical and Electronics Engineers - IEEE - is an international organization with a primary mission of delivering educational services to its members. The system that it is developing may have broad application to other technical societies and to universities throughout the world. In particular, the suite of services available to students should be very useful to electrical and computer engineering programs. This presentation will discuss the system and products being developed and will examine future possibilities.*
