ABSTRACT

Under the Leonardo da Vinci – Lifelong Learning Programme (LLP) – there is a sub-programme, Transfer of Innovation (ToI). ToI is funding projects which further develop previous project outcomes.

This paper deals with a new pilot project under ToI, eGIS+, which has received funding for two years (2007 – 2009). eGIS+ further develop a previous pilot project, E-GIS (*European Level Developments of Flexible Learning Models within Geographical Information Systems (GIS) for Vocational training*), which was successfully implemented 2002 -2006.

GIS, Geographical Information Systems, is a computer –based tool for handling and analysing digital map data to which are connected attribute data (spatially dependent phenomena), for statistical treatment – such as resource- and environmental planning, transport logistics, registration of archaelogical findings etc. There are great needs for competence development within GIS in society. The main aim of the E-GIS was to establish a co-operation between European Universities and GIS user organisations in order to develop modularised courses inteded for Internet based learning. The project outcomes were considered very successful.

In the E-GIS project 10 partners from 6 European countries (Bulgaria, Lithuania, The Netherlands, Norway, Sweden and Portugal) developed a study programme within Geographical Information Systems; resulting in 8 course modules for 100% Internet based learning, corresponding to one year full time study. The course outline were flexible in study pace (open start and end), study mode (online, CD ROM) and material format (text, video, audio and interactive tools) at individual choices.

The objectives of eGIS+ are to target an even broader range of GIS user groups, to test new Learning Management Systems (LMS) and different software for development of course material, translate course material into partner languages, create a large variety of course modules of different duration (modules from just a few minutes duration, without credits, up to 10 ECTS) and to create flexibility to a larger extent.

During the new eGIS+ project, 10 partners from 8 European countries are involved. All University partners from E-GIS joined again plus new partners from Greece and Poland. The project proposal was accepted and eGIS+ was born.

INTRODUCTION

The eGIS+ project [1][2] under the Lifelong Learning Programme (LLP) deals with the experiences from the previous E-GIS project, implemented under the Leonardo da Vinci Programme (www.e-gis.org). The E-GIS courses attracted students from all continents of the World and over four hundred students were enrolled. The course outline were flexible in study pace (open start and end), study mode (online, CD ROM) and material format (text, video, audio and interactive tools) at individual choices.

Results

In the E-GIS project [1][2], 10 partners from six European countries; Bulgaria, Lithuania, The Netherlands, Norway, Sweden and Portugal participated. During the project period a study program, 100 % Internet based,

---

corresponding to one year full time study was implemented – resulting in eight course modules (fig.1) which were developed and tested out during the project.

Course		Content
GIS 1	10 ECTS	A general introduction to GIS. Knowledge about spatial (map) and attribute (e.g. tabular) data.
GIS 2	10 ECTS	Continuing course based on GIS 1. Teaching students how to collect data and handle data bases. Data analysis for solving spatially related issues.
Specification of GIS in Organisations	7,5 ECTS	Identification of user organisations' needs for geographical information, fitting these needs into the current framework (internal and external) and formulate the needs in a specification.
GIS in Physical Planning	10 ECTS	GIS used for physical planning of e.g. individual houses, roads, villages and towns.
GIS in Resource Planning	7,5 ECTS	An introduction to GIS as a planning tool for resource management.
GIS in Environmental Planning	7,5 ECTS	GIS methods in handling environmental data and processes in a GIS environment.
Geographical Data Modeling and Management	7,5 ECTS	Using conceptual schema languages to describe (simple) information models.
Internet GIS	7,5 ECTS	How to visualise geographical data, both as traditional maps and as perspective views and to distribute and use geographical data over Internet.

Fig. 1. Developed E-GIS course modules, level and content

Some interesting figures from the E-GIS project

After analysing the evaluation and statistical data of the students in the courses [1][2], we found that:
- age span of students ranges from 20 to 60 years, with an average of 31 years
- 70% of the students were men and 30% women
- students came mainly from engineering and science backgrounds
- 60% were single, 30% lived family lives with children and 10% were married without children
- 65% stated that they could find a comfortable study environment at home
- 21% were not employed while studying, while 62% were employed full-time, 6% worked halftime and 9% worked part-time
- 10% of students recieved financial support for their studies from their employer
- 4% stated that they did not have easy access to a computer with internet connection while 53% had it at home, 52% at work and 24% found it elsewhere
- 95% felt confident as ICT- and Internet users but 13% felt that computers made studying harder

Challenges

The partnership was spread all over Europe from North to South – and from West to East. Due to this, there were differences in approach to a number of issues around education, such as differences in:
- technical skills and traditions
- copyright problems on learning materials
- Internet facilities

[1] E-mail: Ebba.Ossiannilsson@ced.lu.se
        Hilding.Sponberg@hig.no

- credit/grading systems
- financial situation for staff and students
- problems regarding knowledge control (examination)
- how to merge/reuse learning material from different institutions in a new course
- streamlining
- high drop-out rates
- language skills
- pedagogic approaches.

eGIS+

Due to those experiences, challenges and success of the E-GIS project all former partners agreed on applying for a new project under the Leonardo Life Long Learning Program (LLP), Transfer of Innovation. The project proposal was accepted and eGIS+ was born.

The main idea of this project is to adjust and further develop courses in order to fit the results into a broader range of user organisations and user groups within EU. This will be achieved by identification and analyses of demands and choises, adjustment and development of appropriate material (e.g. by translating parts of courses into partner languages and use new technical tools and pedagogy). The project aims are to try out new digital technologies and create more flexible pedagogical models for adaptation to different types of target groups.

AIMS, OBJECTIVES AND TARGET GROUPS

The GIS courses developed by the E-GIS project were proven to be relevant and of high quality and the E-GIS project was considered successful. However, due to e.g. language difficulties, cultural barriers, diverging views on pedagogy and the use of technology in education, access to not high enough capacity Internet connections and different economic situations they are not as extensively used in some partner countries as anticipated.

The objectives are to:
- develop information material and courses which are accessible at no or low cost. This includes use of open source solutions, both for development and management of courses (Learning Management Systems, LMS, such as e.g. Moodle) and for GIS work to improve accessibility and flexibility for people, organisations and countries with lesser means of funding GIS implementation and use.
- include the European INSPIRE initiative concepts in the courses developed during the past E-GIS project. This includes knowledge transfer concerning new joint European standards for spatial data storing and sharing, as well as how to access these data.
- break down the existing courses into smaller components suitable for training situations outside the traditional academic spheres.
- development of small general courses as well as more specialized ones, depending on target group. Focus will be on three main target groups: employees (for workbased learning, just in place and time to fascilitate flexibility), university students and staff and secondary school teachers.
- widening recruitment by developing new pedagogic concepts targeting sub-groups e.g. disabled persons (WAI-standard), refugee minority groups and prisoners.
- investigate and develop technological solutions.
- reduce language related problems by translating courses and parts of courses to a number of European and non-European languages (e.g. Portuguese, Greek, Spanish, Lithuanian, Bulgarian, Polish, Russian and Arabic, the latter two for minority language groups in Europe).

- involve new partners in the cooperation in order to widen the competence used for course development.
- learning outcomes will be higher qualifications for e.g. easier access to the job market.

The impact envisaged is that people, universities, private- and civil service organisations involved will start using technology and methods developed in the project and see the benefits of GIS as a genuine tool for organising spatial data, and increasing the interest from school teachers and secondary school students.

Typical learning outcomes for people will be higher qualifications suited for specific careers, better understanding of GIS at different levels, and training in using Internet as a learning platform and knowledge and experience in international cooperation.

ACTIVITIES IN EGIS+

The courses from the E-GIS project [1][2], described above (fig.1) will serve as a base and one can study up to a full course or a complete program. The aim ofeGIS+ is to provide shorter courses (more on demand) for different target groups, but probably also with some changes of the content, depending on the specific target group.

The aims will be fulfilled through:
- design, development and organizing a web-portal for information, dissemination and course implementation.
- short modules varying from a few minutes up to a couple of hours. Different presentations adapted to different target groups. Video, audio, pictures, text with local GIS examples in partner countries. The modules will be translated to a number of languages and with open access for anybody.
- extraction of content from E-GIS courses. All partners will contribute to translation and providing national and regional examples. The modules will be free of use for interested people. Necessary GIS software must be of type free of use for end-users.
- two weeks, 3 ECTC short courses (three courses)
  - introduction to GIS
  - special subject eg. archeology
  - covering the implications of INSPIRE on contemporary GIS activities in EU
- revise GIS modules from E-GIS (10 ECTS)

eGIS+ is a typical dissemination project and the efforts and success in dissemination is crucial. The project and it's results will be presented at national and international conferences. The web-portal, is of high value of the dissemination and valorisation process

---

PARTNERS

The partnership comprises the university partners from the previous EGIS project, one new university partner and three new stakeholders within GIS (fig 2).

Gjøvik University College (GUC), Norway (contracing and coordinating institution)
Lund University (LU), Sweden
Bulgarian Academy of Sciences/Solar Terrestrial Influences Laboratory (BAS-STIL), Bulgaria
 University of Patras, Greece (UoP)
Vilniaus Gedimino Technikos Universitetas,(VGTU), Lithuania
Institute for Geo-Information Science and earth Observation (ITC), The Netherlands
Statens kartverk (SK), Norway
Centrum Informacji o Środowisku UNEP/GRID-Warszawa (GRID), Poland
Instituto Superior Técnico/Universidade Técnica de Lisboa (IST), Portugal
Lantmäteriet (LM), Sweden

Fig. 2.   Outline of the partners

CHALLENGES

There are many challenges ahead and those will be penetrated along the project-time. The challenges can be expressed like:
- courses more or less on demand
- small modules to be combined up to a full program
- new pedagogy
- open sources and multimedia tools
- new target groups
- new ideas
- new concepts
- LLL-aspects and the 3rd mission
- new partners
- …and for sure some which we can´t anticipate

EXPECTED RESULTS

Expected results will be to obtain awarness of GIS to a higher extent and to spread the GIS knowledge to broader audiences. This will be fulfilled through activites as shown in fig. 3.

Activity	Expected results
Web-portal for dissemination of GIS information and application examples, linking to GIS course modules.	To develop a Web-portal for all outcomes from the project, some of it being available for free to the public, some password protected. Dissemination of knowledge and awareness of GIS as an exiting and useful tool for society. The objectives are to create interest; among public for GIS, for use in organisations and hopefully among teachers and students to study GIS.
GIS information and application examples and short GIS course modules (max 2 days)	To produce GIS information of various levels and make this available on the web portal. One level will be two to five minutes promotion videos, one will be a two hours GIS introduction and the third level will result in a two-day short course about GIS. Examples from different fields, nations and cultures will be produced and added separately to the web portal. The information courses as well as the examples will be translated to several national and minority groups languages. New teaching and training methodologies and course materials including adaptation of new pedagogic eLearning concepts, technology advancements as open source LMS within GIS, will be implemented. WAI standard will be adapted in order to expand the number of possible beneficiaries. No academic credits are given for attendance and the material is made freely available through the web portal.
GIS 3 ECTS (2 week) short course development	Three courses covering different GIS aspects will be constructed, one introductory course, one dealing with GIS applications e.g. archaeology and one covering the implications of INSPIRE on contemporary GIS activities in EU. The development of course material will involve implementation of new teaching and training methodologies and course materials including adaptation to new eLearning concepts, technology advancements as open source LMS within GIS, and new user categories, hence WAI standard adopted material to expand the number of possible beneficiaries. The courses will be available through the Web-portal and awarded three ECTS credits.
GIS 10 ECTS course revision and adaptation	A basic GIS course intended for Internet based education will be developed. Improvement and further development testing new pedagogic concepts and technologies using an existing course as basis. The course will be adapted to user groups who need deeper basic knowledge about GIS and the use of GIS with particular focus on groups who have difficulties accessing Internet based education programs, e.g. adapt course material to WAI-standard. Course content will be awarded 10 ECTS credits and made available through the Web-portal.
Dissemination, evaluation and valorisation	Two distinct type of dissemination results are discernible; first the dissemination of the project methodologies and best practices and other experiences made during the project concerning e.g. methodology, pedagogy, technology is a major dissemination result and secondly the dissemination of GIS and GIS knowledge and skills aiming totally different target groups. This activity mainly focus on paper production and conference participation for dissemination of results to as many target groups as possible within the European society. The web-portal will constitute an important tool for dissemination.

Fig. 3.   Outline of the partners.

EVALUATION, VALORISATION

The project strategy is to make the portal known to as many potential user and user communities as possible by means of advertising using the networks which already exist between the partners, institutions and organisations inside as well as outside the European Union.

With the geographical and sectorial spreading of the partners in different language spheres, it is obvious that the project will succeed in disseminating this information to a wide variety of places, reaching large number of stakeholders.

Sustainability

One anticipates that further developments of the E-GIS material even more will be attractive in universities and higher education institutions and in the open market among private, civil service organisations and public in general.

Many people nowadays, use GIS applications in daily life unconciously. eGIS+ will create awarness about GIS applications and usability.

The eGIS+ in born, with rich fertilising it will grow, inspire people and society and become sustainable!
